

RADIO

FREQUENCIES BELOW THOSE OF VISIBLE LIGHT

electromagnetic
radiation

TRAVELS BY MEANS OF

oscillating electromagnetic fields that pass through the air and the vacuum

OF SPACE

Each system contains a transmitter. This consists of a source of electrical energy, producing alternating current of a desired frequency of oscillation. The transmitter contains a system to modulate some property of the energy produced to impress a signal on it. This modulation might be as simple as turning the energy on and off, or altering more subtle properties such as amplitude, frequency, phase, or combinations of these properties. The transmitter sends the modulated electrical energy to an antenna. This structure converts the rapidly changing alternating current into an electromagnetic wave that can move through free space.
