Every enclosed space on the new SS *United States* is completely air-conditioned by the most modern system in the world. Air is filtered and dehumidified (actually washed and dried) to eliminate dampness. In every part of the ship you enjoy tangy, fresh sea air without drafts. There is an individual thermostat in every stateroom—so you can choose your own weather whenever you wish.

Speed alone does not make the SS *United States* the superliner that she is. Many features set her apart from other passenger ships. Picture yourself as a passenger on a luxurious transatlantic voyage—or on a sun-splashed cruise. You are a citizen of a small city, complete in itself. But it is the 1,050 officers and crew that give this community its outstanding character.

William Francis Gibbs, 1886–1967 (24 pt)

Prolific American Naval Architect and Designer of the SS *United States* Ocean Liner (18 / 21 pt)

On November 12, 1894, the magnificent new American Liner *St. Louis* made her way down the slipways at the William Cramp Shipyards in Philadelphia. Many dignitaries attended the launch, and first lady Frances Cleveland performed the christening. But certainly the launch of this new liner had the most impact on among its youngest spectators — eight-year-old William Francis Gibbs, son of a wealthy Philadelphia financier. For him, this would become the driving force behind his life. Gibbs later declared that this was the moment he decided to design and build the fastest, safest, and most beautiful ship in the world. (12 / 14 pt)

Throughout his childhood, Gibbs read engineering journals and drew blueprints. His parents however insisted he pursue a more stable career than naval architecture, and the young Gibbs went to law school. He continued to draw plans for ships and taught himself naval engineering without any formal education. He quit his law practice after one year and in 1915 drew up plans for a 1,000 foot ocean liner. Gibbs ultimately got the attention of Admiral David W. Taylor and Secretary of the Navy Josephus Daniels, who encouraged Gibbs to pursue the designs further. World War I put an end to his plans, and the project was put on hold.

Despite Gibbs' lack of formal engineering education, his hard work and attention to detail paid off following World War I. His first major commission was refitting the German liner *Vaterland*, seized by the US during the war and renamed *Leviathan*. His reputation grew, and along with designing many intermediately-sized liners he designed over 70% of the new Navy fleet in World War II (including the famed cargo-carrying "Liberty Ships"). But in spite of these major assignments, his real dream was to build his superliner. He continued to improve and modernize his design, not knowing if it would ever be built. (10 / 12 pt)

After the war however, the United States government began to see the benefits of having a large American-flagged ocean liner. During the war, the United States did not have enough ships to efficiently carry troops to the various fronts, relying instead on the large British passenger liners *Queen Mary* and *Queen Elizabeth* to do the job. With the Cold War looming and an increase in post-war travel, both the US Government and United States Lines (operator of a few smaller transatlantic liners) became interested in Gibbs' 1000-foot liner design, which by that time he had been working on and improving for over thirty years.

At the government's insistence, changes to Gibbs' original design included secret military features in case of a national emergency. In theory, the ship could be converted from a luxury passenger liner to a troop carrier in a mere 48 hours, capable of carrying 14,000 troops over 10,000 nautical miles without needing to stop for fuel or provisions. Construction on the superliner began at Newport News, Virginia in 1950, and the next year she was christened *United States*.

Another special feature of the *United States* was that she was almost entirely fireproof, decorated in streamlined aluminum and glass instead of the typical wood paneling on earlier liners. The result was an iconic mid-century design with that would inspire architects and decorators for years to come.

However the most remarkable feature of Gibbs' new ship was her speed. Gibbs installed the most powerful steam turbines ever produced on the new *United States*, and combined with the weight savings achieved by the ship's aluminum superstructure and components, the ship reached speeds unmatched by any other ocean liner before or since.

United States' maiden voyage in June, 1952 broke all speed records and carried famous names like Vincent Astor, Margaret Truman, and Milton Berle. *United States* proved to be a very popular ship, and during her career she had over one million passengers, including the Duke & Duchess of Windsor, John F. & Jackie Kennedy, Judy Garland, Duke Ellington, Marilyn Monroe, Salvador Dalí, Walt Disney, Prince Rainier & Grace Kelly,

Coco Chanel, Eleanor Roosevelt, Walter Cronkite, and even a young Bill Clinton.

Every time the *United States* sailed into her home port, William Francis Gibbs drove out to the entrance of New York Harbor to meet the ship as she arrived. This continued until Gibbs died in 1967. Two years later, *United States* was retired due to increasing competition from jet aircraft. Over 40 years the ship has sat nearly abandoned, under constant threat of being sold for scrap, awaiting refurbishment and new life as a stationary historic attraction and museum destination in a major American port city.

William Francis Gibbs was, perhaps more than any other marine architect, an "auteur" rather than simply a designer. The construction of the fast and beautiful *United States* was the culmination of a lifelong dream, and the magnum opus of his prolific career as a self-taught architect. The "Gibbs" typeface pays homage to his career and his greatest creation, loosely inspired by *United States'* iconic shipboard signs and adapted for modern display and text purposes. • (9 / 11 pt)

GIBBS

GIBBS is a tough, sophisticated sans, named for prolific maritime architect William Francis Gibbs and inspired by his greatest design, the record-breaking mid-century luxury liner *SS United States*. Taking various cues from the unique cast aluminum signs found on board, the result is truly transatlantic — somewhere in between industrial American vernacular lettering and the English humanist styles of Gill or Johnston. Both stylish and comfortable to read, and with an extensive list of OpenType features, GIBBS allows you to set quality type with ease at both text and display sizes.

Built in 1952, the beautiful *United States* was the most revolutionary ship in the world when new. After a flawless 17-year career, she now sits unused and is in danger of scrapping. Her current owner, the non-profit *SS United States Conservancy*, wishes to restore the ship as a vibrant waterfront development and museum for future generations to enjoy for decades to come.

"The *SS United States* is a monument that should be rallied around and restored."

JOHN MAXTONE-GRAHAM
World-Renowned Maritime Historian

HISTORY

Above Left: The clubby mid-century first class smoking room of the SS *United States*. Photo courtesy of Robert G. Lenzer and the SS United States Conservancy. **Above Right:** The spacious, airy first class dining room. Photo courtesy of Robert G. Lenzer and the SS United States Conservancy. **Below:** Various examples of the unique wayfinding signage found on board. Anne Urquhart and Dorothy Marckwald of the firm Smyth, Urquhart & Marckwald were hired by William Francis Gibbs to provide a cohesive interior decor scheme for the ship, which included these distinctive signs. Photos courtesy of the SS United States Conservancy, Robert G. Lenzer (left, right), and Jim Green (center).

Above: One of the SS *United States*' aluminum signs today, a bit worse for wear. Most of these signs were sold at a 1984 auction, and reside in private collections. The sign is compared with the Gibbs Medium typeface to show the familial resemblance as well as the differences — slightly larger negative spaces, rationalized character widths — chosen to aid readability and allow the caps to work better with the lowercase. The result is a typeface inspired by this unique historical model, retaining some of the quirk of the original while taking into account the needs of contemporary designers.

9/11 PT., BOOK WITH BOLD

Her construction was partially subsidized by the US government, since she was designed to allow conversion to a troop carrier should the need arise. *United States* operated uninterrupted in transatlantic passenger service until 1969. Since 1996 she has been docked at Pier 82 on the Delaware River in Philadelphia. The **SS United States Conservancy** assumed ownership of United States in February 2011.

12/14 PT., BOOK WITH BOLD

United States had the most powerful steam turbines of any merchant marine vessel, with a total power of **over 240,000 shaft horsepower** delivered to four 18-foot diameter manganese-bronze propellers. This gave her the greatest power-to-weight ratio ever achieved in a commercial passenger liner, before or since.

THE AMERICAN FLAGSHIP

A Cocktail Tribute to the SS United States

45ml (1.5oz)	Applejack
30ml (1.0oz)	Southern Comfort liqueur
30ml (1.0oz)	cranberry juice
3 dashes of	Peychaud's Bitters

Stir over ice, strain into a chilled cocktail glass. Garnish with a cocktail cherry.

Supposedly every state in the union provided some components to build the historic *SS United States* ocean liner, and likewise the "American Flagship" cocktail combines ingredients produced only in its namesake country — principally Applejack, a spirit distilled from apples that was a favorite of George Washington. When mixed with Southern Comfort, cranberry, and Peychaud's aromatic bitters, the result is a sweetly spiced tribute to the *SS United States*, and a delicious companion to the Gibbs type family for late-night design sessions.

ANATOMY OF THE SS UNITED STATES

1. **Rudder**—designed for good maneuverability at high speed.
2. **Propellers**—powerful shafts transmit power from turbines to the giant propellers.
3. **Sports Decks**—open to the sun for lounging or playing all types of deck sports.
4. **Funnel**—its top is 175 feet from the keel of the ship, equal in height to a 12-story building.
5. **Lifeboats**—one of 22 aluminum lifeboats, fully fire proof and can accommodate 3000 persons.
6. **Kingposts**—with boom is used to raise and lower cargo.
7. **Radar Mast & Crows Nest**—radar is ship's eyes in night and fog; look-out is always on duty in crow's nest.
8. **Navigation Bridge**—the heart of the ship with almost miraculous navigational equipment and aids.
9. **Anchor & Cable Chain**—the latest in naval design and electrically operated.
