A faering is an open boat with two pairs of oars, commonly found in most boat-building traditions in Western and Northern Norway. Faerings are clinker-built, with planks overlapped and riveted together to form the hull. This type of boat has a history dating back to Viking-era Scandinavia. The small boats found with the 9th century Gokstad ship resemble those still used in Western and Northern Norway,

and testify to a long tradition of boat building. Faerings may carry a small sail, traditionally a square sail, in addition to oars. The only significant difference being a conversion from a side-mounted rudder to stern-mounted. They are used as small fishing vessels in areas of modern Norway, and occasionally raced. The word comes from Norwegian “færing” (Old Norse feræringr), literally meaning “four-oaring”.

Clinker building is a method of constructing hulls of boats and ships by fixing wooden planks and, in the early nineteenth century, iron plates to each other so that the planks overlap along their edges. The overlapping joint is called a land. In any but a very small boat, the individual planks will also be joined end to end; the whole length of one of these composite planks is a strake.
